Project 4 Update: QA Evidence & Artifacts

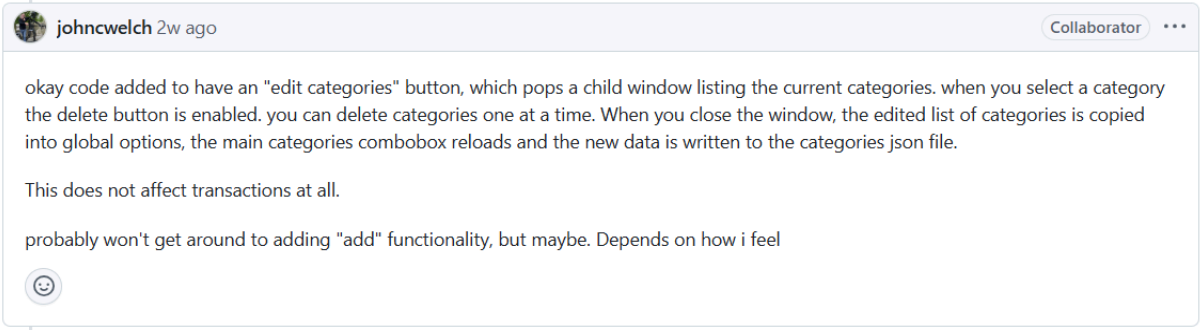

Figure **1 : Issue #17 Resolution & Collaboration**

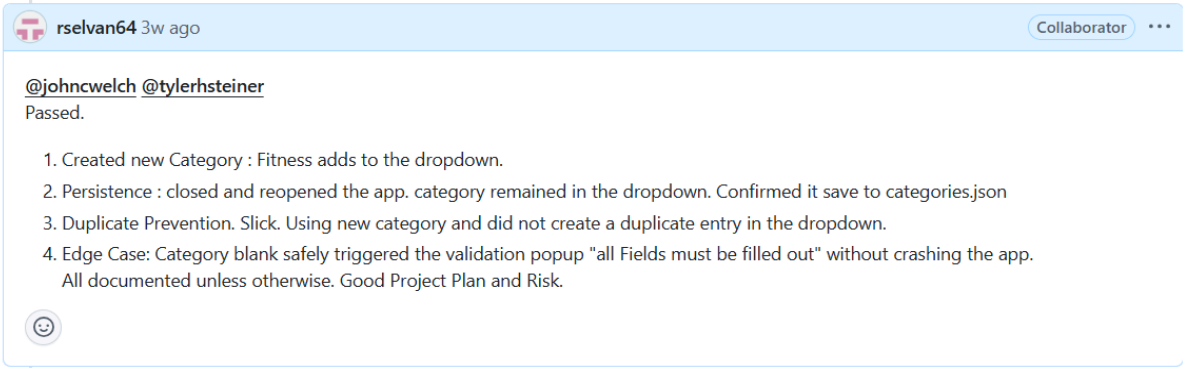

GitHub Issue #17 resolution. QA Validate the fix on the latest dev branch and acknowledge the Lead Dev's incremental commits resolving the zero-selection edge case.

Figure 2: Issue #1 Data SafetyCollaboration.

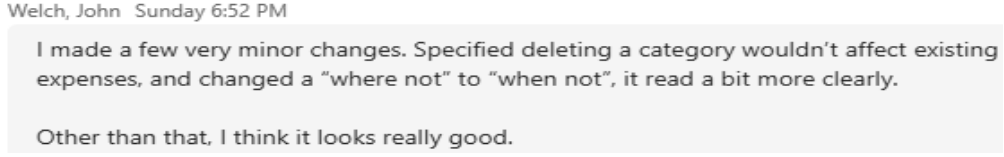

2.1 : Dev1 Github comment confirming category modifications do not affect underlying transaction data.

2.2: Dev2(QA) "passed" Sign-off after rigorously testing persistence,duplicate prevention and edge cases.

2.3: Dev1 - MS Teams message reinforcing the data-safety rule for ongoing team alignment.

Issue #1 Data Safety Collaboration. Dev 1 explicitly confirmed that category modifications do not affect underlying transaction data. Dev 2 (QA) rigorously validated this through testing of persistence and edge cases, officially signing off. This data-safety rule was further reinforced in the team's MS Teams channel.

Figure 3: Project Deliverable 1 Risk Register Update

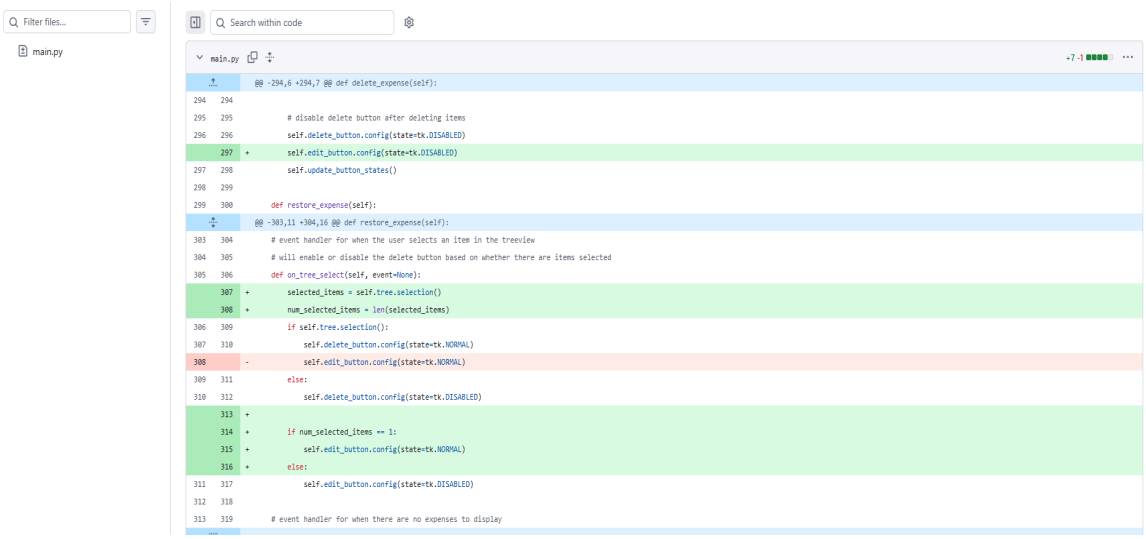

4. Material Risks and Unknowns

The team has identified the following material risks. We will monitor these closely and apply the stated mitigations to keep the project on track.

Risk Unknown	Likelihood	Impact	Owner	Monitor Trigger	Practical Response/Mitigation (What to do)
Data Corruption/Loss during local testing or merges	Medium	High	Dev 2(QA)	Before git merge to main and start/end of local QA Sessions.	QA runs git restore expenses.json post-test. Lead Dev enforces Pull Request reviews before merging.
Data loss or corruption during "Edit" or "Undo" operations	Medium	High	Dev 2(QA)	Prior to git merge and at the start/end of local QA testing.	Dev2 resets local data via git restore expenses.json testing. Lead Dev requires PR reviews before merging to main.
Scope Creep from vague Triage.	Low	Medium	Lead Dev	New feature requests added to "Triage" lacking defines Acceptance Criteria.	Lead Dev rejects to Triage. QA must draft formal Acceptance Criteria and error cases prior to "In Progress" approval.

Upgraded Material Risks table for Project Deliverable 1, featuring specific Monitoring Triggers and Practical Responses to guide team action, directly addressing professor feedback.

Figure 4: Source Code Verification

Source code verification of commit **d8e4f11**. QA traced the UI bug fix to the exact logic update from Line (313 - 316) in the dev branch. Conforming the Edit button now strictly requires a single selection.
